1 Introduction

Welcome to your first document built with Simple Doc. This example project shows how the template converts plain Markdown into a professionally styled PDF — no LaTeX knowledge required.

Everything you see in this PDF was generated from two short Markdown files and a single YAML configuration file. The sections below demonstrate the features available to you.

1.1 What You Can Do

Simple Doc handles the formatting so you can focus on writing. Out of the box, you get:

- Automatic table of contents
- Numbered section headings
- Styled title page with logo support (or a compact header block for short-form docs)
- Page headers and footers
- Professional typography and spacing

1.2 How This Example Is Organized

This document is split across two Markdown files to demonstrate multi-file builds:

File	Contents
content/01-introduction.md	This introduction (you're reading it)
content/02-features.md	Feature showcase with examples

The build script (`build.sh`) combines them in order and produces a single PDF. You can add as many files as you need — just list them under `input-files:` in `project.yaml`.

2 Feature Showcase

This section demonstrates the Markdown features that Simple Doc converts into styled PDF elements. Use these examples as a reference when writing your own documents.

2.1 Text Formatting

Standard Markdown formatting works as expected:

- **Bold text** for emphasis
- *Italic text* for titles or terms
- ~~Strikethrough~~ for corrections
- `inline code` for commands or file names

2.2 Callout Boxes

Simple Doc supports GitHub-style admonitions. Use them to draw attention to important information.

Note

This is a note callout. Use it for supplementary information that adds context without interrupting the main flow.

Tip

Tips highlight best practices or shortcuts the reader might find useful.

Warning

Warnings alert the reader to potential problems or common mistakes.

Important

Important callouts flag information the reader must not skip.

Caution

Caution callouts signal actions that could cause data loss or are difficult to reverse.

You can also give callouts a custom title:

About Custom Titles

Add your title text on the same line as the callout type marker. The title replaces the default label for that callout.

2.3 Tables

Pipe tables keep their natural size when they fit; wide tables get proportional column widths so they never overflow the page:

Setting	Default	Description
toc	true	Show or hide the table of contents
toc-depth	2	How many heading levels to include
secnumdepth	2	How deep section numbering goes
h2-page-break	false	Start each H2 on a new page
short-form	false	Use compact header instead of title page
papersize	letter	Paper size: <code>letter</code> or <code>a4</code>

2.4 Code Blocks

Fenced code blocks render in a monospace font. Specify the language for syntax highlighting:

```
title: "My Document"
author: "Jane Smith"
date: "2025-06-15"
toc: true
```

```
# Build your PDF
./build.sh
```

2.5 Task Lists

- ☒ Install Pandoc
- ☒ Install TeX Live
- ☒ Configure project.yaml
- ☐ Write your content
- ☐ Run build.sh

2.6 Images

Place images in an `images/` directory and reference them in Markdown:

```
![Alt text](images/your-image.png){ width=60% }
```

The template automatically centers images and constrains them so tall images never overflow the page. If you omit the `width` attribute, images default to 80% of the text width.

2.7 Links

Standard Markdown links work normally and are styled with the color defined by `color-link` in `project.yaml`:

[Pandoc User's Guide](#)

2.8 Page Breaks

Every level-1 heading (`#`) automatically starts on a new page. If you need a manual page break elsewhere, insert a raw LaTeX command:

```
\newpage
```

For documents where every level-2 heading (##) should start on a new page, set `h2-page-break: true` in `project.yaml`.

Short-form behavior

When `short-form: true` is set, # H1 headings do *not* force page breaks. The first H1 flows beneath the header block on page 1, and subsequent H1s continue inline as the document flows — appropriate for short documents like memos and briefs where forced page breaks would feel fragmented.
